Industrial Diesel Engines

Hatz Drive Solutions

**1B30, 1B40, 1B50 Silent**

Depending on the engine type the already low noise level can be significantly reduced further, by 2 to 4 decibel [A], by an optional silent noise package, decreased power, and speed. This is possible thanks to optimisations in the area of intake and exhaust components.

**First Full Electronic and Full Variable Speed Control < 19 kW**

The models 1B30E, 1B30VE and 1B50E being part of the E1 family can be controlled with standard J1939 CAN protocols - thanks to the ECU controlling the engine. It is also possible to use CAN-Displays to monitor the engine performance.

# Hatz B-Series: Flexible Solution for All Areas

The Hatz B-Series scores high marks in mobile and stationary operations with compact installation dimensions and for all applications with a power requirement up to 8 kilowatts due to its low weight. With its robustness and longevity, the series sets standards in the market. Regardless of whether on vibration plates or in the inhospitable environment of the Antarctic, the Hatz B-Series has been tried and tested a hundred thousand times in harsh surroundings.

## From a mechanical masterpiece to the smartengine

The Single Cam System patented by Hatz essentially determines the very short overall length of the mechanically controlled engines. The injection pump and the valves are operated by a single cam and rocker arms. The Hatz E1 technology, on the other hand, controls the injection electronically. It enters into a fruitful relationship with the core engine of the B-Series, which has proven its excellence hundreds of thousands of times. And thus creates completely new possibilities.

## Raising digital potentials

The engines can be linked to the Hatz Digital Solutions. These allow key information on machine operation to be integrated into fleet management, thereby enabling machine operators to make better decisions. Also possible: optimization of the machine disposition and maintenance, localization and geofencing, and maximization of machine productivity.

## Environmental aspects

All B series engines have been designed for sustainability and environmental compatibility and undergo continuous development. For many years now, all engines in this series have been produced and sold in compliance with the regulations of the strict US emission standard EPA Tier 4, and this design is also exported to countries where exhaust emission limits are not stipulated. The E1 models fulfill all requirements of EPA Tier 4 final and are the only drive solution that offers variable engine speed.

## One power train – many variants

Thanks to the intelligent design of the engines, it is possible to offer various displacements based on the same power train. For the customer, this provides many options for making the best possible use of the existing space on a machine. Additionally this saves both time and money for the development and construction of entire machinery series.

## Optional silent noise package

Depending on the engine type the current low noise level can be significantly reduced further, by up to 4 decibels [A], by a silent noise package. This is possible thanks to optimisations in the area of intake and exhaust components.

## Awards

The engines of the E1 family won the Diesel Progress Award 2019 for the achievement of the year for the development of the ground breaking engine technology. In 2020, the fiPMG products which are based on the 1B30E, 1B30VE and 1B50E won the Diesel Progress Award for New Power Technology of the Year.

## 1B50E DPF with diesel particulate filter

Although not required by law, Hatz offers the 1B50E engine with an optional passive diesel particulate filter for EU Stage V for defined applications. This makes it possible to work in critical environments such as trenches.

### Performance data

Performance data refer to Standard Reference Conditions of ISO 3046-1 (IFN): +25 °C (77 °F), 100 kPa, relative humidity 30 %. During running-in period the output increases by approx. 5 % which is taken into consideration at delivery. Power reduction acc. to ISO 3046-1. Standard values: Above 100 m ALT approx. 1 % per 100 m. Above 25 °C (77 °F) approx. 4 % per 10 °C (50 °F). The power taken from charging alternator also has to be added to the demand of power.
